Due Saturday October 16th, by 5 pm, electronically using SPARK.

Extending a simple Django application

For this assignment you will extend a simple Django web application modeled after the StackOverflow website. This will serve as the basis for an ongoing project in which you will add successive enhancements to your site, based on features of the StackOverflow website, or of your own design.

1. Follow the directions on this page to initialize your personal django site with starter code we have created for you. Instructions: [Django 101]

2. Extend the code to allow users to submit answers to questions and to view submitted answers for a particular question. This will involve:

   (a) Creating a new model for answers.
   (b) Creating a form for submitting answers.
   (c) Processing the answers submitted.
   (d) Creating a new page that displays answers for a question.

Helpful instructions are available here: [Extending the Web App]

Submission: You will submit the URL to your site, running on the edlab machines, directly through SPARK. Copy the URL into the text box on the submission page. There is no document or code to submit.
